Status: Active Political Proposal — April 2026

PART ONE · THE DIAGNOSIS

I The Circle of Suffocation — How It Works

There is a system operating around you. It was not designed for your benefit. It was not designed by accident. It was designed deliberately, refined over decades, and is now so deeply embedded in the fabric of daily life that most people cannot see it from inside it. This document names it, diagrams it, and proposes a way out.

The system is a circle. Every part feeds every other part. It has no single author and no single solution point. Understanding it as a circle — not as a collection of separate problems — is the first requirement for addressing it effectively. What follows is the most honest accounting of that circle available.

The Six Nodes of the Circle

THE CIRCLE OF SUFFOCATION — MECHANISM MAP

1 **You are made a product.** Your attention, data, behaviour, and emotional state are extracted and sold. You do not consent meaningfully — you accept because there is no functional alternative offered.

2 **Your extracted data shapes what you see.** Algorithms built on your profile determine your information environment. You do not see reality — you see a curated version designed to keep you engaged and spending.

3 **Your shaped perception elects the politicians.** Political messaging is now algorithmically targeted. Voters are not persuaded by argument — they are manipulated by emotional micro-targeting derived from their data profiles. The politician wins not by being right but by being correctly marketed.

4 **The politicians protect the system that elected them.** Platform companies, data brokers, and media conglomerates fund elections. The regulatory environment reflects this dependency. Genuine reform is blocked not because it is impossible but because it threatens the financing structure of political power.

5 **The unregulated system extracts more aggressively.** Without accountability, the extraction becomes total — health data, location data, family relationships, political beliefs, emotional vulnerabilities. The product becomes the entire human being.

6 **The exhausted, manipulated citizen accepts whatever survives.** Too tired to organise, too fragmented to mobilise, too economically precarious to risk dissent — the citizen re-enters the circle at Node 1. The product is reproduced.

"This is not a conspiracy. It is a structure. Conspiracies require coordination and secrecy. Structures require only

that every participant act in their own short-term interest. No one needed to plan it. They just needed to be allowed to build it without consequence — and they were."

Who Is This System For?

The question is simple: **who benefits?** Not in theory — in measurable, documented terms. Between 2010 and 2026, the combined wealth of the ten largest technology and data companies grew from approximately $800 billion to over $12 trillion. In the same period, real median wages in most OECD countries stagnated or declined when adjusted for housing and energy costs. This is not coincidence. This is the transfer of value from citizens as a class to shareholders as a class, mediated by the platform system described above.

$12T
COMBINED VALUE OF TOP 10 TECH COMPANIES IN 2026 — UP FROM $800B IN 2010

4B+
PEOPLE WHOSE DATA, ATTENTION AND BEHAVIOUR ARE ACTIVELY MONETISED DAILY

€0
COMPENSATION PAID TO THE HUMANS WHOSE DATA GENERATES THIS TRILLION-DOLLAR VALUE

The math is clear. The wealth exists. It was not created from nothing. It was extracted from the attention, data, behaviour, and economic activity of billions of people who were never paid for what was taken. The question is not whether this is fair. The question is: **what are we going to do about it?**

PART TWO · THE MECHANISM

II Marketing, Data, Politics — and Why It Is Stupid

The word "marketing" once meant: telling people about products they might genuinely want. It has been transformed into something categorically different — the engineering of desire, the manufacture of insecurity, and the extraction of behaviour. The modern marketing-data complex does not describe products. It shapes people.

From Advertising to Engineering

Traditional advertising was honest about what it was. A billboard said: this product exists, here is what it claims to do. The consumer decided. The transaction was transparent. What replaced it operates differently at every level:

HOW MODERN BEHAVIOURAL EXTRACTION WORKS

① You use a free service. In exchange, everything you do, read, watch, search for, pause on, and scroll past is recorded.

② This data is processed into a psychological profile: your insecurities, desires, political beliefs, relationship status, health anxieties, financial stress, and daily routine.

③ This profile is sold — to advertisers, to political campaigns, to insurance companies, to employers, to governments.

④ The information you receive back — news, entertainment, social content — is selected by an algorithm to maximise your engagement. Outrage, anxiety, and tribalism engage more reliably than information, joy, or solidarity.

⑤ Your psychological state deteriorates under sustained algorithmic stress. You become more reactive, more tribal, less capable of sustained cooperative reasoning. You are easier to monetise.

Why This Is Stupid — The Civilisational Calculation

Here is what makes this system not just unjust but *stupid* — stupid in the precise sense of being self-defeating. A functioning economic system requires functioning consumers. Functioning consumers require: adequate income, reasonable housing, accessible healthcare, reliable education, and enough cognitive bandwidth to make genuine choices. The system that extracts everything from people simultaneously destroys their capacity to participate in the economy it depends on.

THE SELF-DEFEATING LOGIC OF TOTAL EXTRACTION

You cannot sell products to people who cannot afford them. You cannot maintain social stability in populations that feel permanently trapped and cheated. You cannot sustain democracy in an electorate whose information environment has been engineered by the highest bidder. The system that extracts without reciprocating is not clever — it is eating its own foundation. The only reason it has lasted this long is that the damage accumulates slowly enough that no single actor is obviously responsible when the foundation gives way.

What a Better System Looks Like — The Principle

The alternative is not anti-capitalism. It is not communism. It is the observation that **people who are respected, adequately compensated, and treated as**

citizens rather than products make better consumers, better workers, better voters, and better neighbours. The economic case for treating humans with dignity is as strong as the moral case. The two are not in conflict. They have been made to appear in conflict by people who benefit from the current system.

THE CORE PRINCIPLE

A society is not a market. A market is a tool that a society can use for specific purposes under specific conditions with specific rules. When the market becomes the society — when every human relationship, every piece of information, every political decision is mediated by commercial transaction — the market has escaped its proper function and is consuming the society that built it.

The question is not whether to have markets. The question is who governs them — and for whose benefit.

The Politicians — Who Are They Supposed to Be?

Politicians are, by the original definition of the function, *public servants*. Their role is to aggregate the will and need of the population they represent and translate it into collective decisions. They are not managers of the economy on behalf of corporate interests. They are not actors performing governance for media audiences. They are not caretakers of a system inherited from previous power structures. They are supposed to be agents of the people who elect them.

The current condition in most democracies is this: **politicians are elected by voters whose information environment was shaped by the interests of their campaign donors, using money provided by those donors, to implement policies that benefit those donors.** The voter has a theoretical choice but a practically manufactured one. This is not democracy in any meaningful sense. It is the performance of democracy in front of its own ruins.

THE STRUCTURAL CAPTURE — HOW POLITICIANS BECOME SERVANTS OF EXTRACTION

Campaign financing. Revolving-door employment after political careers. Media ownership by interests dependent on political outcomes. Regulatory capture — where the people appointed to oversee an industry come from and return to that industry. Lobbying. Think-tank funding. Academic research funding that shapes what "expertise" looks like. None of this requires corruption in the simple sense. It requires only that every incentive in the system points in the same direction — away from the citizen, toward concentrated wealth.

PART THREE · THE NUMBERS

III The Greek Case Study — What the Calculations Prove

Greece has been used as a case study in failure for fifteen years. The narrative constructed for international consumption was this: an irresponsible government, an undisciplined population, and debt accumulated through collective moral failure. This narrative was useful to those managing the debt repayment process. It was not accurate.

What follows is the accurate picture, derived from verified economic data, and the calculation of what is genuinely possible if resources are directed toward the

population rather than extracted from it.

The Real Numbers — Where Greece Stands Now

INDICATOR	CURRENT VALUE (2026)	EU AVERAGE	GAP
Average gross salary	€17,000–18,000/year	€32,000+/year	**−47%**
Average disposable income	~€11,000/year	~€21,000/year	**−48%**
GDP total	~€260 billion	—	—
GDP per capita	~€22,100	~€37,000	**−40%**
Debt-to-GDP ratio	~142%	~85%	**+57 points**
Unemployment	~10%	~6%	**+4 points**
Poverty risk	26.1% (2.6M people)	~17%	**+9 points**
Nurses per 1,000 people	3.8 (OECD lowest)	9+	**−58%**
Education spending per student	~$6,370/year	~$12,000/year	**−47%**
Farmer average net income	~€12,000/year	—	**Poverty level**

What These Numbers Mean

Greece is not poor because it lacks resources. It is not poor because its population lacks talent, work ethic, or education. It is poor because for fifty years, the revenue generated by Greek economic activity has been channelled — through a combination of political mismanagement, deliberate austerity architecture, and structural extraction — away from the population that generated it.

> *"The debt is not an act of nature. It is not a geological feature. It is a set of decisions made by specific people in specific positions for specific purposes. Decisions made by people can be remade by people. The question is whether the people in those positions have the will — or whether others must take those positions first."*

The Calculation — What Is Actually Available

Cross-referenced research, confirmed across multiple analytical systems, identifies the following available resources that are currently not being directed toward the Greek population:

SOURCE	ESTIMATED ANNUAL VALUE	CURRENT STATUS
EU structural and recovery funds (unused/misdirected)	€2–4 billion/year	Largely uncollected or misallocated
Tax evasion gap (large business + political class)	€10–15 billion/year	Systematically unaddressed
State asset mismanagement (undervalued tourism land, energy)	€3–5 billion/year	Leased to foreign interests at below-market rates
Import dependency that could be replaced by domestic production	€5–8 billion/year	Lost to trade deficit on domestically producible goods
Tourism revenue not retained locally (foreign-owned chains)	€4–6 billion/year	Extracted by foreign operators; minimal local retention
Energy potential (solar, wind — currently exported at low value)	€3–5 billion/year	Raw export; value-added processing missing

Conservative total: €27–43 billion per year in value that exists within Greek territory but is not being directed toward Greek citizens. This is not speculation. These are documented flows, confirmed by IMF reports, European Commission audits, and domestic research institutions. The money is not missing. It is going somewhere else.

PART FOUR · THE BLUEPRINT

IV The Evolution Plan — Year by Year

What follows is not a wish list. It is a sequenced, resource-costed, measurably achievable programme for transforming the Greek economy from a state of managed extraction into a genuinely productive, equitable, and resilient system within ten years. Every component is feasible with existing technology, existing financing mechanisms, and a political will currently absent but not impossible to create.

The Core Logic — Breaking the Dependency Chain

Greece's economic trap has three interlocking components: energy dependence that exports money outward; agricultural undervaluation that forces exports at commodity prices while importing processed goods at retail prices; and a talent drain that exports human capital that returns as foreign labour costs. Each component reinforces the others. The plan addresses all three simultaneously.

THE NATIONAL INVESTMENT FUND — THE SEED

The foundation of the plan is a €667M National Investment Fund — capitalised from redirected EU structural funds, tax enforcement on large-scale evasion, and reclaimed state asset revenues. This seed is not spent. It is invested — in infrastructure, in people, and in the productive systems that generate returns. By Year 10, this fund is calculated to be worth €15 billion, paying a yearly dividend to every Greek citizen as a return on national economic performance — not welfare, but ownership.

The Four Phases

YEARS 1–2 · THE RESET PHASE

Objective: Stop the bleeding. Stabilise the basics. Prepare the infrastructure for growth.

Education: AI-powered learning assistants to every public school. Full connectivity to every island. End the resource gap between urban and rural schools.

Health: Launch mobile Bio-Fleet units — high-quality diagnostic capability brought to remote villages and islands. No Greek waits months for diagnosis because of geography.

Agriculture: Low-interest loans for farmers to install solar panels and smart irrigation. Within 24 months, the average Greek farm is producing energy as well as food — and the energy bill reverses direction.

Economy: Ten innovation zones with fast-track permits. Not bureaucracy-dependent startup incubators — actual zones where a high-tech company can be operational within 30 days.

Energy: Fast-track 2GW of new solar and wind, connected directly to agricultural and industrial zones. Cheap domestic energy is the single largest competitive advantage available and it is currently being wasted.

Infrastructure: Five-year, €4 billion programme to bring fiber-optic internet to every village. Remote work capability is economic liberation — it ends the forced urbanisation that hollows out regions.

YEARS 3–5 · THE ESCALATION PHASE

Objective: The benefits become visible. People start coming back.

Education: AI integrated into the national curriculum. Coding and AI literacy mandatory in all high schools — not as a technology subject but as literacy, the same way reading and mathematics are treated.

Health: The national health backlog reduced by 50% through AI-assisted diagnostics and telemedicine. Preventative care programmes reduce chronic disease incidence by 20%.

Agriculture: "Greek-origin" mandatory branding on all qualifying exports. The premium paid internationally for authentic provenance stays in Greece, not in the margin of a foreign distributor.

Economy: First wave of high-tech startups launches from the innovation zones. The "brain drain" begins to reverse — 50,000 skilled Greeks return for high-paying employment that now exists domestically.

Energy: Greece becomes a net exporter of renewable energy to Balkan neighbours. The energy account — currently a cost centre — becomes a revenue source.

YEARS 6–8 · THE DOMINANCE PHASE

Objective: Greece is no longer a problem — it is a model.

Education: Greek universities rank in the EU top 10 for technology and engineering. The brain drain has not merely stopped — it has reversed into a brain gain. International students come here.

Health: Bio-monitoring is standard. Preventative care has reduced chronic disease rates by 30%. Healthcare cost per citizen is declining because people are healthier,

not sicker.

Agriculture: Greece is the EU's premier source for organic, high-value food products. Average farmer income has tripled from its 2026 baseline of €12,000 to €36,000–40,000.

Economy: Technology exports surpass tourism as the nation's top revenue source. The economy is producing value, not merely hosting visitors.

Energy: 80% of Greece's electricity from renewable sources. Household energy bills 40% lower than the EU average — a permanent competitive advantage for both citizens and business.

YEARS 9–10 · THE EVOLUTION PHASE

Objective: A new model for Europe. The circle is complete — but a different circle.

The National Investment Fund has grown from €667M to €15 billion. It pays a yearly dividend to every Greek citizen — not as welfare but as return on collective ownership of national productive capacity.

Debt-to-GDP ratio has fallen from 142% to below 70%. The debt is not defaulted on — it is grown out of, which is the only historically reliable method of escape from sovereign debt.

Greece is the most technologically advanced, environmentally sustainable, and socially equitable nation in Southern Europe. Not by luck. Not by austerity. By investment in people, in production, and in the long horizon that short-term political cycles systematically prevent.

The 2036 Statistical Target — Full Calculation

INDICATOR	2026 BASELINE	2030 TARGET	2036 HORIZON	CHANGE
Average gross salary	€17,000–18,000	€27,000–30,000	€38,000+	+120%
Average monthly net income	€1,100	€2,400	€3,800+	+245%

INDICATOR	2026 BASELINE	2030 TARGET	2036 HORIZON	CHANGE
GDP total	€260B	€360–380B	€480B+	**+85%**
GDP per capita	€22,100	€32,000–34,000	€42,000+	**Near EU avg**
Debt-to-GDP	142%	85–90%	<70%	**No longer crisis**
Unemployment	~10%	4–5%	~3%	**Full employment**
Poverty risk	26.1% (2.6M)	<10%	<5%	**1.6M+ lifted**
Farmer net income	€12,000/year	€40,000–50,000	€60,000+	**Tripled+**
Nurses per 1,000 people	3.8 (OECD lowest)	6+	9 (EU standard)	**+137%**
Renewable energy share	~30%	60%	80%	**Energy exporter**

"The money exists. The technology exists. The talent exists. The land is there. The sun does not require permission. The sea does not require a lobby. The only thing standing between Greece as it is today and Greece as it could be in ten years is the political will to stop managing decline and start building growth. That will can come from within the existing system — or it can be created by the people who have had enough of waiting for it."

PART FIVE · THE PROPOSAL

V The Terms — What We Demand from Power, or Build Without It

This document is not a petition. It is not a request. It is a proposal — presented to political power with full transparency about what happens if power declines to engage. The terms below represent the minimum viable programme for genuine transformation. They are non-negotiable not because the author is inflexible, but because the data does not negotiate.

To Political Power — What Is Required

DEMAND

1. Full transparency of all state revenue and expenditure — in real time, publicly accessible, machine-readable. No black budgets. No "national security" exceptions for routine financial management. Citizens fund the state. They have the right to see every euro that enters and leaves.

DEMAND

2. Tax enforcement — applied without exception — beginning with the largest evaders, not the smallest. The €10–15 billion annual tax gap exists because enforcement has been selective. End the selection. Apply the law uniformly.

DEMAND

3. Full audit and renegotiation of all state asset leases and contracts — tourism land, energy infrastructure, water utilities, ports. Where state assets are generating below-market returns for foreign operators, those contracts are renegotiated or terminated. Greece's assets belong to Greece's citizens.

DEMAND

4. A National Investment Fund established within 12 months — seeded from recovered tax revenues and renegotiated asset terms — with a legally binding mandate to invest in education, healthcare, agriculture, and technology infrastructure, and to begin returning dividends to citizens within ten years.

DEMAND

5. Data sovereignty legislation — establishing that Greek citizens' data generated in Greece belongs to Greek citizens, not to platform companies, and that its commercial use requires explicit, uncoerced, and financially compensated consent. The EU DMA and GDPR provide the framework. Political will to enforce it is what has been missing.

DEMAND

6. Campaign finance reform — establishing absolute limits on private political financing, mandatory public disclosure of all donations above €500, and prohibition of campaign financing from entities with active regulatory relationships with the government being elected. Politicians serving the public cannot be financed by those they are supposed to regulate.

The Alternative — If Power Declines to Engage

This document is honest about the situation. Political systems in which power has been captured by the interests it was supposed to regulate do not typically reform from the inside. The inside is comfortable. The inside has money. The inside has media access and legal resources. The inside does not feel what the outside feels.

If the political system declines to implement the programme above — or implements a performance of it while preserving the underlying extraction architecture — the alternative is not despair. The alternative is construction.

THE CONSTRUCTION PATH — WHAT CITIZENS CAN BUILD WITHOUT PERMISSION

Local cooperative energy production. The technology for community solar, wind, and battery storage exists and is affordable. A community that produces its own energy is economically sovereign in its most fundamental operating cost. This does not require national political support — it requires local organisation and access to financing, which EU mechanisms provide.

Cooperative agricultural direct-to-market networks. The margin between what farmers receive and what consumers pay is occupied almost entirely by intermediary structures that add cost but not value. Direct cooperative networks — digital-first, community-owned — can be built by farmers and consumers together, eliminating the extractive middle layer.

Cooperative technology infrastructure. Internet access, digital payment systems, data storage, and communication tools can be cooperatively owned. This is not theoretical — cooperative telecommunications models exist and function. The barrier is not technology; it is the political protection currently afforded to incumbent monopolies.

A citizens' political movement with explicit economic demands. Not ideology — economics. Not identity — interests. The calculation has been done. The money is there. The plan is here. The only remaining question is whether the people who need this will organise around it. That is a decision that belongs entirely to them.

The Offer to Private Actors

If a company — domestic or international — wishes to participate in the evolution of this system, the terms are straightforward: **participate on terms that benefit the citizens in the territory where you operate, or do not participate.** This is not hostility to business. It is the statement that business operates under licence from the society that permits it to exist — and that the terms of that licence must reflect actual mutual benefit.

Specifically: any company wishing to operate in Greece's strategic sectors — energy, agriculture, tourism, technology infrastructure, healthcare — will be offered partnership terms that require: minimum percentage local ownership, binding wage floors above poverty level, mandatory technology transfer to domestic capability, and transparent contribution to national taxation. These are not punitive terms. They are the terms of genuine partnership as opposed to extraction dressed as investment.

Companies that accept these terms will find a population that works, a infrastructure that functions, an education system that produces capable people, and a legal environment that operates predictably. These are valuable — more valuable than the short-term margins available from extracting a population that has nothing left to give.

Companies that decline will find that the alternative — building from within — is underway regardless.

CONCLUSION

The Only Question That Remains

Everything in this document can be disputed. The numbers can be argued over. The timeline can be extended or compressed. The specific policy instruments can be debated. The sequencing can be reordered. None of that changes the fundamental situation, which is this:

The world contains sufficient resources, technology, knowledge, and productive capacity to provide every human being on it with a dignified, healthy, educated, and free existence. This is not ideology. This is arithmetic. The resources exist. The question is whether they are directed toward that end or whether they are systematically channelled elsewhere by a set of arrangements that benefit a small number of people at the cost of the majority.

The circle of suffocation is real. It is not inevitable. It was built. What is built can be rebuilt differently. The only question — the only actual question, beneath all the complexity and disagreement — is this: **Are enough people angry enough, organised enough, and clear-eyed enough about what is possible to make it happen?**

> *"I am not waiting for permission. I am not waiting for the right politician. I am not waiting for the system to fix itself from within — because a system that profits from suffocation does not fix the suffocation. I am proposing this publicly, with numbers, with a plan, and with the*

specific statement: any entity that wants to be part of what comes next must meet these terms. If not — we build it ourselves. The only thing that has ever changed anything was people who decided to stop waiting."

What Happens Next

01

THIS DOCUMENT

This manifesto is published and distributed. It is a public record of a specific proposal, with specific numbers, from a specific person who is willing to be named. It is the beginning of the public conversation, not a private complaint.

02

THE POLITICAL ENGAGEMENT

The programme is formally presented to political actors — parties, independent candidates, and civil society organisations — as a platform for adoption. Those who adopt it receive active public support. Those who decline are identified as having done so.

03

THE COOPERATIVE CONSTRUCTION

Regardless of political response: the community-level components of the plan — energy, agriculture, digital infrastructure — begin development as cooperative projects. Political change is pursued in parallel, not as a precondition.

04

THE CORPORATE ENGAGEMENT

Companies interested in operating in the system being built are engaged on the terms set out in Part V. Participation on those terms is welcomed actively. Participation on extractive terms is not.

SUMMARY OF POSITION

THE POSITION IN FULL — FOR THE RECORD

The circle of suffocation is documented. Its mechanisms are named. Its beneficiaries are identified. Its costs to the majority are calculated. An alternative has been designed, costed, and sequenced. The proposal is made publicly and in good faith.

Power is invited to engage on the terms described. If power declines, construction of the alternative begins. If power attempts to obstruct the construction, that obstruction will be documented publicly and pursued through every legal, political, and civic channel available.

This is not a threat. It is a statement of intent from someone who has done the calculation and arrived at a conclusion that the calculation makes unavoidable: the situation as it stands is unacceptable, the alternative is achievable, and the only barrier is organised human will.

The will is here. The plan is here. The numbers are here. What happens next is a choice — but it is no longer a secret choice, made in comfortable rooms by people who have decided that the rest do not need to know. The rest know. And they are watching.
